

SPOJ Problem Set (classical)

375. Query on a tree

Problem code: QTREE

You are given a tree (an acyclic undirected connected graph) with N nodes, and edges numbered 1, 2, 3... $N-1$.

We will ask you to perform some instructions of the following form:

- **CHANGE i t_i** : change the cost of the i -th edge to t_i
or
- **QUERY a b** : ask for the maximum edge cost on the path from node a to node b

Input

The first line of input contains an integer t , the number of test cases ($t \leq 20$). t test cases follow.

For each test case:

- In the first line there is an integer N ($N \leq 10000$),
- In the next $N-1$ lines, the i -th line describes the i -th edge: a line with three integers a b c denotes an edge between a , b of cost c ($c \leq 1000000$),
- The next lines contain instructions "**CHANGE i t_i** " or "**QUERY a b** ",
- The end of each test case is signified by the string "**DONE**".

There is one blank line between successive tests.

Output

For each "**QUERY**" operation, write one integer representing its result.

Example

Input :

```
1
3
1 2 1
2 3 2
QUERY 1 2
CHANGE 1 3
QUERY 1 2
DONE
```

Output :

```
1
3
```
